General Office – MS Office, VS Code, Google Apps, Adobe Creative Suite

Experience

Southern Methodist University

June 2020 – Dec. 2020

Full Stack Web Development

Currently enrolled in a 24-week full stack web development program at SMU learning coding technologies and languages to be sufficient in building full stack web applications with skill sets in both front-end and back-end.

Some of the projects I have worked on:

- **Space Stocks** – an app that simplifies the information gathering of stocks. Our simple to use app pulls the latest stock gainers, along with RSI data via Financial Modeling Preps api to recommend whether to buy, sell, or hold a specific stock. As part of a team for this group project on the front end I worked on the material-ui and foundation frameworks for layout and styling using React App for the build. We utilized a React Google authorization package for the login/signup of the app. We then build our own algorithm based on the api call and data to recommend whether you should buy, sell, or hold a specific stock.
- **White Glove Detailing** – worked with a team creating an app that allows users to select and pay for a car detailing package to be completed while they are shopping. Used Node, Express server, Handlebars.js as the template engine, MySQL database with Sequelize ORM and utilized GET and POST routes for retrieving and adding data. Also used bcrypt for encrypting the user passwords.
- **ZOOLY** – worked with a team to develop an app where users could input the name of an animal, and it would return Giphy's of the animal as well as recommended books to learn more about the animal. Utilized both the Giphy and Google Books API's for calling and retrieving the data. Front-end was designed with HTML and Materialize CSS.
- **Burger Logger App** – created a restaurant app that lets users input the names of burgers they'd like to eat. When a burger name is submitted the app displays the burger on the left side of the page waiting to be devoured. Once the burger is devoured it is moved to the right side of the page under the devoured list. The app stores every burger in the database whether devoured or not. Technologies used to create the app were MySQL, Node, Express, Handlebars and a homemade ORM.

- **Weather Dashboard** – created an app that allows users to input cities and see what the weather along with a 5-day forecast. Used a third-party API from OpenWeather to retrieve weather data for cities and display dynamically on the webpage using HTML and CSS.

iHeartMedia
Broadcast Media

June 2019 – May 2020

Multi-Media Marketing Consultant

- Worked with key stakeholders across clients in developing marketing strategies
- Planned and executed marketing tactic across radio, streaming audio, podcasts, OTT, targeted display, social media, email, as well as local events.
